MoneyPrinter YT — Project Guide

Generated 10 Nov 2026

One place for each project: what counts as "complete", where its code lives, and its shareable bot template. Projects that aren't finished don't get a published template.

MoneyPrinter YT (this repo)

Automated faceless Shorts: AI script, AI scene images, Gemini voice, captions, scheduled delivery.

Projects, type and what each produces:

Project	Type	Produces
MoneyPrinterTurbo-plus (Telegram bot, Mini App, web studio, API, on-server autopilot)	App	1. Finished 30–60 s vertical Shorts (mp4) with voiceover and captions. 2. A ready-to-paste title, description and hashtags for each video. 3. Delivery: to Telegram today; YouTube and TikTok uploads once connected.
HunyuanVideo / Wan Kaggle clip add-on (`hunyuan/`, n8n + Kaggle batch)	Workflow	1. Short AI video clips (about 3 s) for each scene, used in place of still images. 2. Weekly GPU quota and status reports in the n8n control form.

Complete means all of these:

- Done: Videos generate on their own on the server (2 finance Shorts a day, 09:00 and 18:00 WAT, delivered to Telegram).
- To do: Auto-posting to YouTube (needs a Google sign-in on the n8n upload workflow).
- To do: Auto-posting to TikTok (choose a TikTok developer app or Buffer).
- To do: The free Kaggle AI-clip add-on is switched on (needs a Kaggle token, see VIDEO_APP_GUIDE.md).
- To do: The script AI is reliable (fix the relay, or keep Gemini as the main one).

Template: "MoneyPrinter YT". A draft exists, unpublished until the items above are done.

Run it without the assistant: README, VIDEO_APP_GUIDE.md, hunyuan/README.md.

Other projects

Each of the other agents adds its own section here: its projects, whether each is a workflow or an app, what each produces, its completion definition, its repo, and its template. These get added as they come in.

Project	Agent	Type	Produces	Complete?	Template
MoneyPrinterTurbo-plus	MoneyPrinter YT	App	Shorts videos, post text, delivery	No (see above)	Draft
Kaggle clip add-on	MoneyPrinter YT	Workflow	AI scene clips	No (switched off)	Part of MoneyPrinter YT

Video app operator guide (no assistant needed)

This guide is for running the free AI-clip add-on yourself. Everything runs on your own accounts: the MoneyPrinter server, your n8n server, Kaggle, Google Drive, and this GitHub repo.

Status: prepared, not switched on. Today MoneyPrinter uses FLUX pictures with Ken Burns motion. That keeps working whether or not this add-on is on.

What you need

- A Kaggle account with a verified phone number. Get the API token from Kaggle, under Settings, then API, then Create New Token.
- SSH access to the n8n server and the MoneyPrinter server.

1. Put in your Kaggle token (one time)

On the n8n server, edit the worker secrets file (template: `hunyuan/gpu.env.example`):

```
sudo nano /opt/ytauto/kaggle/secrets/gpu.env     # set KAGGLE_USERNAME and KAGGLE_KEY
sudo chmod 600 /opt/ytauto/kaggle/secrets/gpu.env
```

Never commit this file or paste it anywhere public.

2. Switch it on

1. In n8n, open **GPU Bridge**, **GPU Router**, and **MPT HunyuanVideo Clip Generator**. Re-pick their credentials if asked, then click **Publish/Activate**.
2. On the MoneyPrinter server, add the `VIDEO_CLIP_*` lines from `hunyuan/mpt_patch/INTEGRATION.md` to `/opt/moneyprinterturbo/.env`, then:

```
cd /opt/moneyprinterturbo && sudo docker compose --profile tunnel up -d api
```

3. Check it

- Open the **MPT Video App Control** form in n8n (it's password protected). It shows your Kaggle hours left and the queue, and lets you **Run batch now** or **Selftest**.
- Or on the n8n server: `python3 /opt/ytauto/scripts/gpu/kaggle_launch.py quota`

4. Switch it off

- Fast: in n8n, set `MPT_GPU_CLIPS=off`. MoneyPrinter then falls back to pictures straight away.
- Fully: clear `VIDEO_CLIP_BACKEND_URL=` in the MoneyPrinter `.env` and run the same `docker compose ... up -d api`.

When the weekly Kaggle hours run out

You don't need to do anything. Jobs fall back to pictures, and the quota resets weekly. You get about 30 GPU hours a week, shared with YouTube Auto.

Change the model

Set `VIDEO_CLIP_MODEL` in the MoneyPrinter `.env`. The options are `wan21-diffusers` (default), `ltx-t2v` (fastest), `hy15-i2v` (HunyuanVideo 1.5, which animates your FLUX picture) and `wan22-5b-diffusers`. Restart the api container after changing it. Run **Selftest** before using `hy15-i2v`, and keep it only if one clip takes 8 minutes or less.

After a server reboot

The containers restart on their own. If they don't:

```
cd /opt/moneyprinterturbo && sudo docker compose --profile tunnel up -d
cd /opt/ytauto && sudo docker compose up -d
```

Kaggle rules to respect

Use batch jobs only, with no tunnels or always-on servers, and one launcher per account. Kaggle's terms say personal, non-commercial use, so treat it as a bonus that could stop.
